Level #2 Assignment - Road Trip Planner
IS 303 - Hilton

Create a Python program that estimates the cost of a road trip. Your program will ask the user for trip information, perform calculations, and display a personalized trip-cost summary.

Your program should ask the user for:

- User's name
- Destination
- One-way distance in miles
- Vehicle miles per gallon
- Gas price per gallon
- Number of travelers

Your program should calculate:

- Total miles for the round trip
- Gallons of gas needed
- Estimated gas cost
- Estimated cost per traveler

Display a readable trip summary that includes:

- The traveler's name
- The destination
- The total estimated cost
- The estimated cost per traveler

Sample Session:

(NOTE: Does not need to be the exact same wording.)

```
==================================
ROAD TRIP PLANNER
==================================

What is your name? Jordan
Where are you traveling? Moab
How many miles is the trip one way? 240
What is your vehicle's miles per gallon? 30
What is the gas price per gallon? 4.50
How many travelers are going? 4

==================================
TRIP SUMMARY
==================================
Traveler: JORDAN
Destination: Moab

Gallons of Gas: 16
Gas cost: $72.0

Cost per traveler: $18.0
==================================
Have a great trip!
```

NOTES:

- Use appropriate data conversion to store the data
- Make sure to include comments
- Use meaningful variable names using “snake case”
- Use at least one f-string to display variables in your output.
- Use the .upper method somewhere in the program

Before submitting, test your program from beginning to end and make sure it works with reasonable sample values. (No need to worry about invalid input for this assignment.)

Upload the .py file to the Level #2 Assignment via Canvas.
