Level #04 Assignment: Personal Expense Analyzer

IS 303 – Hilton

Create a Python program that analyzes a series of personal expenses.

Repeatedly ask the user to enter expenses until they enter a 0 to indicate they are finished entering expenses. Ensure that the expenses that the user inputs are valid (i.e. not negative.)

(**NOTE:** The easiest way to store expenses will be to use a Python list. We have not covered in class how to add things to a list, so you will need to figure out how to do that.)

Once all the expenses have been entered, first classify each expense:

- Less than `$25`: Small expense
- `$25` through `$100`: Moderate expense
- Greater than `$100`: Large expense

Then print out the results for user:

- Total number of expenses
- Total expenses
- Average expense
- Smallest expense
- Largest expense
- Number of small, medium, and large expenses

Make sure to format all the dollar amounts properly.

Submit your **PUBLIC** GitHub link via Canvas.

Sample Run

NOTE: Your output does not need to match this example exactly, but it should provide equivalent information:

```
Enter an expense or 0 to finish: 12.50
Enter an expense or 0 to finish: 48.75
Enter an expense or 0 to finish: 1250
Enter an expense or 0 to finish: 0
```

```
Expense Summary
---------------
Number of expenses: 3
Total: $1,311.25
Average: $437.08
Smallest expense: $12.50
Largest expense: $1,250.00

Small expenses: 1
Moderate expenses: 1
Large expenses: 1
```
